

Ink/doctoring cup Accessories

- Clearly reduced increase of viscosity
- Increased mechanical stiffness of the form
- Durable material
- Better handling thanks to useful details
- Easy cleaning

Patent pending!

The successor with a sophisticated ventilation system

The existing 90 mm ink/doctoring cup made of plastics has been replaced by a new one with an improved ventilation concept and a completely revised design. Optimized plastic material, easier cleaning, minor increase of viscosity and simplified handling were the main focus during development. The result is impressive: A more stable printing process thanks to an increased stability of the viscosity.

New

Innovative ventilation concept

The new ink/doctoring cap has a unique ventilation system which considerably reduces the increase of viscosity of the pad printing ink. That is to say: The printing characteristics of the ink remain longer preserved and this allows a stable printing process for a longer time.

The design of the ink/doctoring cup was revised focussing on ergonomic aspects and thus making the handling easier and more convenient. For example, there is now a recessed grip on the outside.

Useful closing cap

Thanks to the hemispherical form the cleaning is very easy. The ink/doctoring cup has a fill level mark for 100 ml on the inside. In addition, the rounded form in connection with the material offers an increased stiffness of the form.

The new closing cap can be easily opened without tools and it is immediately apparent whether the ventilation is open or closed.

Ergonomic recessed grip

The user can continue using the existing accessory parts such as e.g. assembly table, gripping tongs and thrust collar. The new ink/doctoring cup can be used as usual in TAMPOPRINT „hermetic“ pad printing machines.
